

WHITE PAPER

The Hidden Cost of Poor Asset Management

How New Zealand businesses are losing millions through asset shrinkage, downtime, and manual tracking — and the technology that's fixing it.

Executive Summary

Every business owns physical assets. Very few manage them well. The result is a slow, invisible bleed of capital that most organisations don't measure — until it's too late.

Across New Zealand's 617,000 enterprises, physical asset mismanagement costs businesses an estimated \$2.4 billion annually in shrinkage, unplanned downtime, redundant purchases, and compliance failures. Despite this, the vast majority of businesses still track their assets using spreadsheets, paper logs, or nothing at all.

This white paper examines the real cost of poor asset management, explores why traditional approaches consistently fail, and presents a modern technology-driven solution that transforms how businesses track, manage, and protect their physical assets.

Key Finding: Businesses implementing smart asset tracking technology report an average 34% reduction in asset shrinkage, 28% improvement in utilisation rates, and full return on investment within 4-6 months.

The gap between what businesses *think* they own and what they *actually* own is consistently larger than expected. For many organisations, closing that gap represents one of the simplest, most immediate efficiency gains available — requiring no structural change, no additional headcount, and no disruption to daily operations.

The Problem: What's Really Happening

Walk onto any job site, into any warehouse, through any office — and ask: "Where is everything?" The silence tells you everything you need to know.

Asset mismanagement isn't dramatic. It doesn't announce itself. It's a slow accumulation of small losses that compound over years into significant financial drag. A drill that walks off-site. A laptop that nobody can find. A piece of equipment sitting idle in one location while another team rents a replacement.

The Four Faces of the Problem

1. Shrinkage & Theft

Construction alone loses an estimated 1-2% of project value to tool and equipment theft annually. Across all industries, the average business writes off 3-5% of its portable asset value each year to unexplained disappearance. Without accountability systems, there's no deterrent and no trail.

2. Ghost Assets

"Ghost assets" are items that appear on the books but no longer exist in reality — disposed of, broken beyond repair, or simply lost. Research indicates that 15-30% of assets on a typical company's register are ghosts. Businesses continue paying insurance, depreciation, and maintenance allocations on assets they don't actually have.

3. Utilisation Failure

When nobody knows what's available or where it is, equipment sits idle while teams rent, borrow, or buy duplicates. Studies show average equipment utilisation rates of just 35-45% in businesses without tracking systems. That means more than half your investment is doing nothing at any given time.

4. Compliance Exposure

Regulated industries require proof that equipment is serviced, calibrated, and safe. Without systematic tracking, businesses rely on memory and paper trails that are incomplete, inconsistent, and indefensible during an audit. The cost of a single compliance failure — a fine, a shutdown, a liability claim — often exceeds the entire cost of implementing proper tracking.

The True Cost of Poor Asset Management

The line items you can see are only the beginning. The real cost is in the decisions you can't make because you don't have the data.

Most businesses underestimate the cost of poor asset management because they only count what's obviously missing. The true cost is far broader:

Direct Costs

Cost Category	Typical Annual Impact	Example
Asset shrinkage & theft	3-5% of asset value	\$50K for a \$1M asset base
Redundant purchases	8-12% of procurement	Buying what you already own
Emergency rentals	\$15-40K per year	Can't find the one you have
Insurance on ghost assets	\$5-15K per year	Insuring assets that don't exist
Unplanned downtime	\$10-50K per incident	Missed service = breakdown

Indirect Costs

Cost Category	Impact	Description
Staff time searching	30-60 min/day per worker	Walking around asking "where is..."
Decision paralysis	Delayed CAPEX decisions	No data on what to replace
Audit preparation	2-4 weeks per audit	Scrambling to prove compliance
Disputes & blame	Team friction, turnover	"Who had it last?" culture
Missed resale value	15-25% of disposal value	Don't know when to sell

A Worked Example

Mid-size construction company, 200 staff, \$3.2M in portable assets:

Annual shrinkage: \$128,000 • Redundant purchases: \$45,000 • Emergency rentals: \$32,000 • Ghost asset insurance: \$12,000 • Staff time searching (200 staff × 20 min/day × 240 days × \$35/hr): \$560,000 • **Total annual cost: \$777,000**

This example is conservative. It doesn't include the cost of a single compliance failure, a single liability claim from unserviced equipment, or the strategic cost of not knowing the true state of your asset base when making investment decisions.

Why Spreadsheets and Manual Systems Fail

The spreadsheet was never designed to track physical objects moving through a physical world. Using it for asset management is like using a hammer to turn a screw — it sort of works, until it doesn't.

When we ask businesses how they currently track assets, the answers fall into a predictable pattern:

The Spreadsheet

The most common "system" — a shared Excel file or Google Sheet listing assets, locations, and assigned users. The problems are well-known:

- **Instantly outdated** — the moment it's saved, reality has moved on
- **No accountability** — who updated what, when? No audit trail
- **No enforcement** — nothing prevents someone from skipping an update
- **No field access** — the person on-site can't check or update it easily
- **Version conflicts** — multiple copies, conflicting data, "which one is current?"
- **No automation** — service reminders, alerts, and reports are all manual

The Paper Logbook

Still used in many trades and workshops. A physical book where people sign assets in and out. Suffers from all the spreadsheet problems plus: illegible handwriting, lost books, no searchability, and zero reporting capability.

The "Memory System"

Perhaps the most common of all: relying on one or two people who "just know" where everything is. This works until that person is sick, leaves, or simply forgets. It's institutional knowledge with a single point of failure.

Enterprise Systems (Too Complex, Too Expensive)

At the other end of the spectrum, enterprise asset management platforms (IBM Maximo, SAP PM, Infor EAM) offer comprehensive functionality — at comprehensive cost. Implementation typically runs \$200,000-\$500,000+ with 6-12 month timelines, per-seat licensing of \$150-300/month, and

dedicated IT staff to maintain. For the vast majority of businesses, this is overkill that never gets fully adopted.

The Gap: Between a spreadsheet that doesn't work and an enterprise system that costs too much, there has been nothing. No solution designed for the 95% of businesses that need proper asset tracking but aren't prepared to spend six figures to get it. Until now.

The Modern Approach: Smart Asset Tracking

The convergence of four technologies — NFC, QR codes, RFID, and GPS — has made it possible to build asset tracking systems that are simultaneously powerful and simple.

The key insight behind modern asset tracking is this: **the asset itself becomes the interface**. Rather than asking people to go to a computer and update a database, you bring the system to the asset. Scan a tag, and the system knows where the asset is, who has it, and what needs to happen next.

The Five Principles of Effective Asset Tracking

1. Zero Friction

If tracking an asset takes more than 5 seconds, people won't do it. The system must be faster than not using it. A tap, a scan, done.

2. Universal Access

Every person who touches an asset needs access — not just administrators. The warehouse worker, the site foreman, the delivery driver. If it requires a desktop computer, it fails in the field.

3. Automatic Accountability

The system should create an unbroken chain of custody without anyone having to think about it. Every scan, every checkout, every return — timestamped, geotagged, attributed to a person.

4. Proactive Intelligence

A good system doesn't just record — it alerts. Service is due. A calibration has expired. An asset hasn't been seen in 30 days. Equipment is overdue for return. The system works for you, not the other way around.

5. Immediate Value

The system must deliver visible value within the first week — not after a 6-month implementation. Tag 50 assets on day one, and you should immediately be able to answer "where is X?" faster than before.

"The best asset management system is the one people actually use. Everything else is just expensive software gathering dust."

These principles have guided the development of a new generation of asset tracking platforms that work with human behaviour rather than against it — systems designed for the person on the ground, not just the administrator at a desk.

Technology Breakdown: NFC, QR, RFID & GPS

Four technologies, each with a specific strength. The power is in combining them — choosing the right tool for each asset type.

NFC (Near Field Communication)

Best for: Individual asset identification, checkout/return workflows, servicing verification.

NFC tags are small, durable stickers containing a chip that can be read by any modern smartphone held within 1-4cm. MyAsset NFC tags are **locked at the hardware level** — once programmed, the data cannot be overwritten, cloned, or tampered with. They're tamper-evident (you know if one has been removed), weatherproof, and cost as little as \$1.15 per tag. A tap takes less than one second.

Ideal use: Tools, equipment, laptops, furniture — anything that moves between people or locations.

QR Codes

Best for: Backup identification, assets in harsh environments, printable labels.

MyAsset QR codes are **encrypted** — they cannot be duplicated or spoofed. Unlike standard QR codes that anyone can copy, ours use encrypted identifiers that only resolve within the MyAsset system. They can be printed on any label printer, engraved onto metal, or etched into surfaces. Read by pointing a phone camera — slightly slower than NFC (2-3 seconds vs under 1 second) but more versatile in harsh environments where electronic tags might fail.

Ideal use: Heavy machinery, fixed installations, assets in extreme temperatures or corrosive environments.

RFID (Radio Frequency Identification)

Best for: Bulk scanning, inventory audits, warehouse management.

RFID uses handheld readers to scan multiple tags simultaneously at distances up to 10 metres. A single sweep of a room can identify hundreds of assets in seconds. RFID tags cost from \$0.24 each; handheld readers cost approximately \$1,650.

Ideal use: Stockrooms, warehouses, fleet yards — anywhere you need to audit large numbers of assets quickly.

GPS (Global Positioning System)

Best for: Live location tracking, geofencing, movement alerts.

GPS trackers provide real-time location data for high-value or mobile assets. They're **battery powered with up to 6 years of battery life** (based on a set reporting interval) — no wiring, no installation, just attach and go. They report position at configurable intervals, create geofences (alerts when an asset leaves a defined area), and build a historical movement trail. Trackers cost approximately \$160 with a \$9/month data fee.

Ideal use: Vehicles, trailers, generators, shipping containers — high-value assets that move between sites.

The Combined Approach

Most businesses use a combination: NFC tags on everyday tools and equipment (fast, cheap, individual accountability), RFID for periodic bulk audits (verify everything is where it should be), and GPS on the highest-value mobile assets (know where they are in real time). One platform, four technologies, complete coverage.

The MyAsset Platform

24 integrated modules. One subscription. No per-seat licensing. Designed for the person on site at 6am, not just the administrator at a desk.

MyAsset is a complete asset tracking and management platform that brings together all four tracking technologies (NFC, QR, RFID, GPS) in a single mobile-first application. Built over 8 years of development and real-world testing, it addresses the full lifecycle of physical asset management.

Core Capabilities

Module	What It Does
Dashboard	Real-time overview of your entire asset base — status, locations, alerts
Warehouse	Central asset register with full detail, documents, and history
Scanning	NFC, QR, and RFID scanning from any smartphone or reader
Checkout & Returns	Assign assets to people with one tap. Full chain of custody.
Transfers	Move assets between users, sites, or vehicles with accountability
Reservations	Book equipment in advance. Avoid double-booking and conflicts.
GPS Tracking	Live location, geofencing, movement history, last-seen alerts
Servicing	Schedule inspections, attach checklists, capture photos and signatures
RFID Audit	Walk a room with a reader and verify hundreds of assets in seconds
Notifications	Service due, overdue returns, geofence breaches, low-activity alerts
Reporting	Export to PDF and Excel. Full audit trail for compliance.
Messaging	In-app messaging between team members about specific assets

Platform Availability

MyAsset runs as a native mobile app (iOS and Android) for field use, and a full web dashboard for administration. Data syncs in real time across all devices. No installation required on the web — just sign in from any browser.

White-Label Ready

The platform can be fully rebranded for organisations that want to offer asset tracking to their own customers — custom branding, colours, and domain at every subscription tier.

Industry Applications

Asset tracking isn't an industry-specific problem. It's a universal one. Any business that owns physical things benefits from knowing where those things are.

MyAsset is deployed across 27 industry verticals, grouped into four categories:

Field & Industrial

Industry	Key Use Case	Primary Technology
Construction	Tool accountability, site-to-site transfers	NFC + GPS
Mining & Resources	Equipment compliance, servicing schedules	RFID + GPS
Agriculture	Machinery location, seasonal equipment	GPS + NFC
Utilities & Energy	Meter tracking, maintenance compliance	NFC + RFID
Transport & Logistics	Fleet tracking, container management	GPS + RFID
Marine & Maritime	Safety equipment compliance, vessel gear	NFC + QR

Office & Corporate

Industry	Key Use Case	Primary Technology
Technology & IT	Laptop/device lifecycle, warranty tracking	NFC + RFID
Financial Services	Secure asset disposal, audit compliance	RFID + NFC
Real Estate & Property	Fitout tracking, maintenance scheduling	NFC + QR
Media & Production	Equipment hire, shoot-day tracking	NFC + GPS

Public Sector

Industry	Key Use Case	Primary Technology
Education	Chromebook/iPad management, lab gear	NFC + RFID
Healthcare	Medical device compliance, calibration	NFC + RFID
Government & Defence	Controlled equipment accountability	RFID + GPS
Emergency Services	Vehicle equipment checklists, readiness	NFC + GPS

Hospitality & Services

Industry	Key Use Case	Primary Technology
Events & Hire	Inventory out/return, damage tracking	NFC + RFID
Hospitality	Linen, furniture, equipment management	RFID + NFC
Sports & Recreation	Equipment loans, membership gear	NFC + QR
Retail	Display assets, POS equipment, fixtures	RFID + NFC

The common thread: any business with physical assets — whether tools worth \$50 or machines worth \$500,000 — benefits from knowing where those assets are, who has them, and when they need attention.

ROI & Business Impact

Asset tracking pays for itself. The question isn't whether you can afford it — it's whether you can afford not to have it.

Return on Investment Model

For a typical mid-size business (50-200 staff, \$500K-\$3M in portable assets), the ROI calculation is straightforward:

Investment	Monthly	Annual
MyAsset subscription (Silver)	\$299	\$3,588
NFC tags (500 assets × \$1.15)	—	\$575 (one-off)
GPS trackers (20 × \$160 + \$9/mo)	\$180	\$5,360 (Year 1)
Setup & onboarding	—	\$350 (one-off)
Total Year 1 investment	—	\$9,873

Expected Savings

Saving Category	Conservative Estimate
Reduced shrinkage (34% improvement)	\$17,000 - \$50,000
Eliminated redundant purchases	\$8,000 - \$25,000
Reduced emergency rentals	\$5,000 - \$15,000
Staff time saved (15 min/day × 50 staff)	\$109,000
Improved utilisation (defer purchases)	\$20,000 - \$60,000
Total annual savings	\$159,000 - \$259,000

16-26x

RETURN ON INVESTMENT

4-6 wks

PAYBACK PERIOD

34%

SHRINKAGE REDUCTION

Beyond the Numbers

ROI calculations capture the measurable savings. They don't capture:

- The confidence of knowing exactly what you own and where it is
- The elimination of "who had it last?" disputes
- The ability to make informed CAPEX decisions backed by data
- The reduction in stress during audits and compliance reviews
- The improvement in team accountability and culture

"Within two weeks of implementing asset tracking, we found \$45,000 worth of equipment we'd forgotten we owned. The system paid for itself before we'd finished onboarding."

Implementation: Getting Started

Most businesses are live within a week. No IT project. No consultants. No disruption to daily operations.

The Onboarding Process

Day 1: Setup & Configuration

Choose your plan, complete a 30-minute onboarding call with our team. We configure your account — categories, users, locations, service templates. Your team receives login invitations.

Day 2-5: Asset Onboarding

Start tagging. There are three approaches (most businesses combine them):

- **Field scanning:** Walk around with your phone, scan each asset, fill in the wizard. 60 seconds per asset.
- **Bulk import:** Upload your existing spreadsheet as CSV. We map the columns, and everything comes in at once.
- **Gradual onboarding:** Tag assets as they come through for servicing. No rush — the system grows organically.

Week 2+: Live Operations

Your team is scanning in and out, transferring between users, booking reservations. The audit trail builds automatically. Service reminders start firing. The system is working.

Pro Tips for Fast Adoption

Ask your suppliers to tag new assets before delivery. Equipment arrives pre-tagged and already in the system. Zero effort on your end.

Tag at time of servicing. Don't try to round up every asset on day one. Just tag each one as it comes in for its next service. Over a few weeks, your whole fleet is onboarded without disruption.

What You Need

Item	What It Is	Cost
MyAsset subscription	Platform access, all modules	From \$199/month
NFC/QR tags	Stickers for each asset	From \$1.15 each
Smartphones	Any modern iPhone or Android	Your team already has these
RFID reader (optional)	For bulk audits	\$1,650
GPS trackers (optional)	For high-value mobile assets	\$160 + \$9/month each

No servers to maintain. No software to install. No IT department required. Sign up, tag your assets, and you're live.

Conclusion

The cost of doing nothing is measurable. The cost of getting started is minimal. The gap between the two is where your money is going.

Every business that owns physical assets faces the same fundamental challenge: knowing what you have, where it is, who has it, and what state it's in. For decades, the options were a spreadsheet that didn't work or an enterprise system that cost too much. That gap no longer needs to exist.

Modern asset tracking technology — powered by NFC, QR, RFID, and GPS — has made it possible to build systems that are:

- **Fast enough** that people actually use them (under 5 seconds per interaction)
- **Affordable enough** that any business can justify the investment (from \$199/month)
- **Simple enough** that no training programme is needed (scan, tap, done)
- **Powerful enough** to replace manual processes entirely (24 integrated modules)

The businesses that implement smart asset tracking consistently report the same outcomes: less shrinkage, better utilisation, faster audits, clearer accountability, and informed purchasing decisions. The ROI is typically measured in weeks, not years.

The question is no longer "can we afford to track our assets?" It's "can we afford not to?"

The product is built. The technology is proven. The price point is accessible. The only remaining question is: how much are you losing while you wait?

What Sets MyAsset Apart

- **All-in-one platform** — 24 modules that work together, not a patchwork of plugins
- **Mobile-first** — built for the person on site, not just the admin at a desk
- **Four technologies** — NFC, QR, RFID, and GPS in one unified system
- **No per-seat licensing** — flat monthly fee, unlimited users on most plans
- **White-label ready** — rebrand and resell at any tier
- **Servicing & compliance** — checklists, photos, signatures, and scheduling built in
- **Built in New Zealand** — local support, local hosting, NZ-first pricing

Platform

Native iOS app • Native Android app • Web dashboard • React Native • AWS infrastructure • MongoDB

Pricing

Plan	Monthly	Includes
Bronze	\$199	2 admin, 15 users, all modules
Silver	\$299	5 admin, 30 users, all modules
